Plug for Some Neat New Products.	28

New Versions

Bob Matzinger has adapted the S-C Macro Assembler for the Basis 108. His revision uses the full capabilities of the Basis keyboard, and operates in 80-column mode. Bob also added some new Escape functions:

Escape A - Turns on automatic line numbering
Escape M - Turns off " " "
Escape C - Catalog the current disk
Escape S - Automatic SAVE to the file named in first line
 * of program

If you have the Basis 108, and already own the S-C Macro Assembler, I'll send you a copy of the Basis version for \$20.

We are currently working on an Apple /// version of the S-C Macro Assembler. Whew! It's no easy task! Do any of you use the Apple ///? My hat is off to you.

The Apple II-E should be out by the time you are reading this. We understand that there are changes in the ROM and DOS, which will probably affect our programs. If so, we'll let you know what the details are next month.

Super Scroller.....Jeffrey Scott
East Norwalk, CT

I am a manager of a software department in a company that makes computerized money counting equipment (6502 based). We have two programming departments: one which is called "applications" (Pascal and BASIC only) and another called "software engineering" where we use assembly language.

We use the S-C Macro Assembler after having sampled all others. And in fact, with my Apple II, 5 Mbyte hard drive, and 3.6 MHz "Number Nine 6502" plug-in board, I can assemble a 300-page source program in about 2.5 minutes!

I love the Apple II, but I don't like being tied to an operating system that I didn't write myself. I use RWTS, but for the rest I use my own code.

I remember one day trying to output to the screen while receiving at 2400 baud. The Apple monitor's scroll was so slow that I lost the first few characters from the front of every line. While writing my own substitute scroll routine, the idea was born that the absolute fastest scroll would be straight in-line code: one "LDA \$xxxx...STA \$xxxx" pair for each byte on the screen.

Just for fun, I wrote the following program, which generates the 960 LDA-STA pairs to scroll the whole screen! The generator program is only 145 bytes long, but it "writes" a program 5521 bytes long!

This "Super Scroller" is not for everyone...it requires a spare 5521 bytes (\$1591) of memory somewhere. If you do, you need only equate "PGM.START.IN.RAM" to your available area, call "PGM.TO.WRITE.SCROLLING.PGM", and then you can call the Super Scroller at "PGM.START.IN.RAM whenever you need it.

Since the scroller can be generated whenever it is needed, it can be part of an overlay environment. You only need a 5.5K buffer available at the right times. At other times the same memory can be used other ways.

To illustrate the speediness of Super Scroller, I wrote a memory dump whose output is the same as the Apple monitor memory dump. It is set up to display from \$0000 through \$BFFF. With Super Scroller, it takes only about 51 seconds; without, it takes 2 minutes 57 seconds (over three times longer!).

Someone might object that I did not clear the bottom line after scrolling up. I elected to just write a fresh bottom line, and clear to the end of line after the last new character is written.

S-C Macro Assembler (the best there is!).....	\$80.00
Upgrade from Version 4.0 to MACRO.....	\$27.50
Source code of Version 4.0 on disk.....	\$95.00
Fully commented, easy to understand and modify to your own tastes.	
S-C Macro Assembler /// (coming soon!).....	\$???.00

Applesoft Source Code on Disk.....\$50.00
Very heavily commented. Requires Applesoft and S-C Assembler.

ES-CAPE: Extended S-C Applesoft Program Editor.....\$60.00

AAL Quarterly Disks.....each \$15.00
Each disk contains all the source code from three issues of "Apple
Assembly Line", to save you lots of typing and testing time.
QD#1: Oct-Dec 1980 QD#2: Jan-Mar 1981 QD#3: Apr-Jun 1981
QD#4: Jul-Sep 1981 QD#5: Oct-Dec 1981 QD#6: Jan-Mar 1982
QD#7: Apr-Jun 1982 QD#8: Jul-Sep 1982 QD#9: Oct-Dec 1982

Double Precision Floating Point for Applesoft.....\$50.00
Provides 21-digit precision for Applesoft programs.
Includes sample Applesoft subroutines for standard math functions.

FLASH! Integer BASIC Compiler (Laumer Research)..... \$79.00
Source Code for FLASH! Runtime Package..... \$39.00

Super Disk Copy III (Sensible Software).....	(reg. \$30.00)	\$27.00
Amper-Magic (Anthro-Digital).....	(reg. \$75.00)	\$67.50
Amper-Magic Volume 2 (Anthro-Digital).....	(reg. \$35.00)	\$30.00
Quick-Trace (Anthro-Digital).....	(reg. \$50.00)	\$45.00
Cross-Reference and Dis-Assembler (Rak-Ware).....		\$45.00
Apple White Line Trace (Lone Star Industrial Computing).....		\$50.00
(A unique learning tool)		

Blank Diskettes (with hub rings)..... package of 20 for \$50.00
 Small 3-ring binder with 10 vinyl disk pages and disks..... \$36.00
 Vinyl disk pages, 6"x8.5", hold one disk each..... 10 for \$4.50
 Reload your own NEC PC-8023 ribbon cartridges..... each ribbon \$5.00
 Reload your own NEC Spinwriter Multi-Strike Film cartridges.... each \$2.50
 Diskette Mailing Protectors..... 10-99: 40 cents each
 100 or more: 25 cents each

Ashby Shift-Key Mod.....\$15.00
Lower-Case Display Encoder ROM.....\$25.00
Only Revision level 7 or later Apples.

&Amper-Magic

T.M.

MACHINE LANGUAGE SPEED WHERE IT COUNTS... IN YOUR PROGRAM!

Some routines on this disk are:

- Binary file info
 - Delete array
 - Disassemble memory
 - Dump substrings
 - Find 2-byte values
 - Gosub to variable
 - Goto to variable
 - Hex memory dump
 - Input anything
 - Move memory
 - Multiple poke decimal
 - Multiple poke hex
 - Print w/o word break
 - Restore special data
 - Speed up Applesoft
 - Store 2-byte values
 - Swap variables
- For the first time, Amper-Magic makes it easy for people who don't know machine language to use its power! Now you can attach slick, finished machine language routines to your Applesoft programs in seconds! And interface them by name, not by address!**
- You simply give each routine a name of your choice, perform the append procedure once at about 15 seconds per routine, and the machine language becomes a permanent part of your BASIC program. (Of course, you can remove it if you want to.) Up to 255 relocatable machine language routines can be attached to a BASIC program and then called by name. We supply some 20 routines on this disk. More can be entered from magazines. And more library disks are in the works.
- These routines and more can be attached and accessed easily. For example, to allow the typing of commas and colons in a response (not normally allowed in Applesoft), you just attach the Input Anything routine and put this line in your program:
- ```
xxx PRINT "PLEASE ENTER THE DATE.", : & INPUT,DATE$
```

**Micro Cookbook, vol. 1 (Review).....Bill Morgan**

Here are some more details about Don Lancaster's other new book, "Micro Cookbook, vol. 1 -- Fundamentals." As I said last month, the focus of the book is what to learn and how to learn it. He emphasizes "what actually gets used", rather than an exhaustive coverage of all possibilities.

The best quick description of the book is an excerpt from the Preface:

Our aim is to show you how micros work, and how you can profit from and enjoy the micro revolution.

We start with the power and the underlying idea behind all micros. From there we build up the framework for all the important micro concepts and terms. The microprocessor families are broken down into three simple and easily understood schools.

Chapter Two starts with a set of rules for winning the micro game. These rules have been thoroughly tested in the real world and are not at all what you might expect. After that, we check into many of the resources that are available to you as a micro user. A survey of micro trainers is included.

The Funny Numbers section (Chapter 3) shows you ways to use and understand the number systems involved in micros, particularly binary and hexadecimal. From there, we look at logic, both as hardware gates and as software commands.

The fourth chapter is all about codes. The important codes that are covered include straight binary, 2's complement binary, ASCII, BCD, instruction codes, user port codes, and various serial data-transmission codes and standards. The 2's complement codings are presented in a new and understandable way.

Chapter 5 tells us many things about memory. We go into electronic memory -- beginning with simple latches and progressing to clocked flip-flops. Mainstream microcomputer memory is attacked next -- from static RAMS up through dynamic RAM, ROM, PROM, EPROM, and EEPROM memories.

"Micro Cookbook -- Fundamentals" is just that: Fundamental. I am a complete novice on hardware. After reading Lancaster's book, I still can't design custom interfaces for my Apple, but I can now read the more technical books without getting totally lost. I have a better understanding of address decoding and of what the memory chips are really doing. The book is informative, enlightening, and entertaining. I recommend it.

This Cookbook is about 360 pages of text, plus appendices and index. There are many drawings and charts. List price is \$15.95. We will be selling it for \$15.00 + postage.

## Funny Opcode Names in the 6801 Manual.....Bob Sander-Cederlof

Paul Lundgren (of Microcomp, Inc. in Newtown, CT) brought some interesting facts to my attention today. When I implemented my 6801 Cross Assemblers, I used what was at the time the latest documentatin available. Paul had some printed two years later, and there were some differences.

For some reason, the Motorola 6801 Reference Manual changes the name of the ASL and ASLD opcodes to LSL and LSID. There is no difference in operation, just a difference in spelling. The S-C Cross Assembler only recognizes the ASL and ASLD spellings. The opcode tables are near the end of the assembler, so you can easily find these entries to change them if you feel strongly about it.

The Motorola book also lists alias names for the BCC and BCS opcodes. In the 6801 (or other 68xx chips), carry clear means the last test was greater or equal, so the alias name is BHS (Branch if High or Same). Carry set means the test was smaller, so the alias is BLO. Note that the meaning of carry after a comparison in the 68xx chips is exactly the opposite of carry in the 6502!

Here are some macros to use for BHS and BLO:

```
.MA BHS
BCC]1
.EM

.MA BLO
BCS]1
.EM
```

Some assemblers for the 6502 have two alias opcodes for BCC and BCS. For example, LISA has BLT for BCC (Branch if Less Than), and BGE for BCS (Branch if Greater than or Equal). [ I didn't do this in the S-C Assemblers because the meaning depends on whether the values tested are considered to be signed or unsigned. ]

Here are two macros to implement BLT and BGE in the 6502 version of the S-C Macro Assembler:

```
.MA BLT
BCC]1
.EM

.MA BGE
BCS]1
.EM
```

An Addition to CATALOG ARRANGER.....Dave Barkovitch

I really like Bill Morgan's CATALOG ARRANGER, from the October issue of AAL.. There is something I want to change, though.

When you move the cursor to the end of a long catalog, the cursor stays in the middle of the screen and the catalog scrolls up, until only the top half of the screen is filled. Here are some patches to make the cursor move down to the end, and keep 22 files on the screen:

```
2931 LDA NUMBER.OF.ELEMENTS
2932 SEC
2933 SBC #LINE.COUNT
2934 BPL .5
2935 LDA #ZERO
2936 .5 STA LAST.ELEMENT

3830 BPL .7

3841 BEQ .1
3842 .7 CMP LAST.ELEMENT
3843 BCC .1
3844 LDA LAST.ELEMENT

5991 LAST.ELEMENT .BS 1
```

And Another Change.....Bill Collins

CATALOG ARRANGER is a great utility. Here are a couple of things you might like to know:

1. Version 4.0 of the S-C Assembler will not accept division in the operand. If you have that version then change line 3820 to SBC #11.
2. If you have DOS relocated into a RAM card you need to add the following lines for bank switching purposes:

```
1165 MONREAD .EQ $C082
1167 DOSREAD .EQ $C083
```

Then add BIT MONREAD at these positions: Lines 1675, 3785, 3855, 3895, 4015 ("."5" moved to this line), 4205 ("."3" moved to this line), 4315, 4425, 4455 ("."7" moved to this line).

And add BIT DOSREAD at these spots: Lines 1535-36, 1685-86, 3795-96, 3905-06, 3975-76, 4035-36, 4215-16, 4345-46, 4465-66, 4955-56.

Also, all DOS addresses must be moved up 16K (lines 1180-1310.) \$Axxx addresses become \$Exxx and \$Bxxx become \$Fxxx.

## A Filename Editor for CATALOG ARRANGER.....Bill Morgan

Many thanks to all of you who have called and written to say how much you like the CATALOG ARRANGER. I'm glad to hear that others find it as useful as I do. Here's my favorite addition to the program, the ability to edit the filename in the cursor. Now you can alter a name by inserting or deleting characters, you can insert control characters, and you can place display titles in the catalog, using normal, inverse, flashing, or lower case text.

There are a couple of unique features in this editor. The cursor clearly indicates Insert, Overtype, or Override mode, and also shows whether the input will be Normal, Inverse, Flashing, or Lower Case. The display unambiguously shows all these types, plus Control. The price of all this clarity is three display lines for one text line, but that's no problem in a program like this. You can easily adapt the concepts shown here to edit any line of forty or fewer characters. The same principles also apply to longer lines, but the screen display would have to be handled carefully.

### Installation

To add FILENAME EDITOR to CATALOG ARRANGER just type in S.FILENAME.EDITOR from this listing, and save it on the same disk with S.CATALOG.ARRANGER. Then LOAD S.CATALOG.ARRANGER and make the following changes and additions:

```
1030 .TF CATALOG.ARRANGER.NEW
1480 LINE.COUNT .EQ 21
1915 CMP #$85 ^E
1920 BNE .1
1922 JSR RENAME.FILE
1924 JMP DISPLAY.AND.READ.KEY
5865 .IN S.FILENAME.EDITOR
```

Then SAVE the new S.CATALOG.ARRANGER and assemble it.

### Operation

To rename a file, just use the arrow keys to move the cursor to the file you want, and type "CTRL-E" (for Edit). The name you selected will appear near the bottom of the screen, between square brackets. Any control characters in the name will have a bar above them. The caret below the first character of the name is the cursor. Any non-control characters you type will replace the characters on the screen. Control characters will have the effects shown in the command list below. Especially note that RETURN will enter the name in the lower buffer into the filename array, ESC will return you to the Arranger without altering the filename, and CTRL-R will restore the original filename.

One way to have fun with this program is to put dummy files in the catalog, for titles or just for decoration. First get into Applesoft and SAVE as many dummy programs (10 REM, for example) as you need. Then BRUN CATALOG ARRANGER, move the dummy programs to where you want them, and play with the names. If you start the new file name with six CTRL-H's and six spaces, it will blank out the "A 002 " before the name. You can use inverse, flashing or lower case text in titles. If you insert CTRL-M's (RETURNS) after a name there will be blank lines in the catalog. Play with it for a while, and let me know if you come up with any especially neat tricks.

Here are the commands:

<-- -- Left Arrow. Move the cursor left one position.  
--> -- Right Arrow. Move the cursor right one position.  
RETURN -- Enter. Enter the changed name into the upper display and return to arranging.  
ESC -- Escape. Return to arranging, without entering the changed name.  
^B -- Beginning. Move the cursor to the beginning of the line.  
^D -- Delete. Delete one character at the cursor.  
^E -- End. Move the cursor to the end of the name.  
^F -- Find. Move the cursor to a particular character.  
Type "^FA" to move the cursor to the next "A" in the name. Type another "A" to move to the following "A", and so on. Any character other than the search key will be entered or executed.  
^I -- Insert. Turn on Insert Mode. Following characters will be inserted to the left of the backslash cursor. Any control character turns Insert off.  
^O -- Override. Insert the next character typed "as is". This allows you to insert control characters into a name.  
^R -- Restore. Restore the name to its original condition, as it appears in the upper display.  
^S -- Shift Mode. Cycle between Normal, Inverse, Flashing, and Lower Case entry. The cursor changes to show the current mode.  
^Z -- Zap. Remove all characters from the cursor to the end of the name.

#### How it All Works

When you type CTRL-E to enter the editor, line 1090 transfers the filename into an edit buffer located in the screen memory at \$757-\$774. The main loop of the editor is lines 1190-1320. All through the editor the Y-register is the cursor position in the line. The routine DISPLAY.EDIT.BUFFER places the brackets before and after the name, puts bars over any control characters, displays the cursor, and gets the next keystroke. The main loop then checks whether that key was a control.

| OBEF- | 68       | 2170          | PLA                  | ADDRESS AND              |           |
| OBEF- | 4C 43 0B | 2180          | JMP RENAME.FILE      | START OVER               |           |

If the keypress was not a control character, it is passed to the input section (lines 1340-1570), where the character is masked according to the current MASK.MODE (Normal, Inverse, Flashing, or Lower-case) and either inserted or just placed in the line. The program then jumps back to E.START to redisplay the buffer and get the next key.

If you do enter a control character, the program JSR's to the SEARCH.AND.PERFORM routine at lines 3250-3390 (taken straight from Bob's article in the August '82 AAL.) Here we look up the command key in the table at lines 3420-3550 and do a PHA, PHA, RTS type branch to the appropriate command handler, or to the monitor's BELL, if the command didn't match anything in the table.

Almost all of the command handlers end with an RTS that returns control to line 1320. The exceptions are OVERRIDE (lines 1590-1650) and RESTORE (lines 2150-2180), since they exit through internal JMP's, and RETURN/ESC (lines 2660-2720), since those return to the main program. Another oddity is the FIND routine (lines 2420-2640), since it has two exits. Line 2640 returns to line 1320 through the BELL routine. Lines 2590-2620 are needed to process a keystroke that is not a repetition of the search key.

#### RAM/ROM PROGRAM DEVELOPMENT BOARD

\$35.00

Plugs into any Apple slot. Holds one user-supplied 2Kx8 memory chip. Use a 6116 type RAM chip for program development or just extra memory. Plugin a programmed 2716 EPROM to keep your favorite routines 'on-line'. Maps into \$Cn00-\$CnFF and \$C800-\$CFFF memory space. Instructions & circuit diagram provided.

#### The 'MIRROR': Firmware for Apple-Cat

\$29.00

Communications ROM plugs directly into Novation's modem card. Three basic modes: Dumb Terminal, Remote Console & Programmable Modem. Added features include: Printer buffer, Pulse or Tone dialing, true dialtone detection, audible ring detect and ring-back option. Directly supports many 80-column boards (even while printing) and Apple's Comm card commands. (Apple-Cat Hardware differences prevent 100% interchangability with Comm card.) Includes Hayes-to-AppleCat register equivalances for software conversion. Telephone Software Connection (213-516-9430) has several programs which support the 'MIRROR'.

#### The 'PERFORMER': Smarts For Your Printer

\$49.00

Get the most from your smart printer by adding intelligence to your 'dumb' interface card. The PERFORMER Board plugs into any Apple slot for immediate access (no programs to find and load). Easily select printer fonts and many other features via a user-friendly menu. Replaces manual printer set-up. No need to remember ESC commands. Also provides TEXT and GRAPHICS screen dumps. Compatible with Apple, Tymac, Epson, Microtek and similar 'dumb' Centronics type parallel I/F boards. Specify printer: EPSON MX80 W/Grafxax-80, EPSON MX100, EPSON MX80/MX100 W/Grafxax Plus, NEC 8023A, C.Itoh 8510 (ProWriter), OKI Microline 82A/83A W/OKIGRAPH. (OKI Bonus: The PERFORMER Generates ENHANCED and DOUBLE STRIKE Fonts)

## S-C Macro Cross Assemblers

The high cost of dedicated microprocessor development systems has forced many technical people to look for alternate methods to develop programs for the various popular microprocessors. Combining the versatile Apple II with the S-C Macro Assembler provides a cost effective and powerful development system. Hobbyists and engineers alike will find the friendly combination the easiest and best way to extend their skills to other microprocessors.

The S-C Macro Cross Assemblers are all identical in operation to the S-C Macro Assembler; only the language assembled is different. They are sold as upgrade packages to the S-C Macro Assembler. The S-C Macro Assembler, complete with 100-page reference manual, costs \$80; once you have it, you may add as many Cross Assemblers as you wish at a nominal price. The following S-C Macro Cross Assembler versions are now available, or soon will be:

|           |                |      |         |
|-----------|----------------|------|---------|
| Motorola: | 6800/6801/6802 | now  | \$32.50 |
|           | 6805           | now  | \$32.50 |
|           | 6809           | now  | \$32.50 |
|           | 68000          | now  | \$50    |
| Intel:    | 8048           | now  | \$32.50 |
|           | 8051           | soon | \$32.50 |
|           | 8085           | soon | \$32.50 |
| Zilog:    | Z-80           | now  | \$32.50 |
| RCA:      | 1802/1805      | soon | \$32.50 |
| Rockwell: | 65C02          | now  | \$20    |

The S-C Macro Assembler family is well known for its ease-of-use and powerful features. Thousands of users in over 30 countries and in every type of industry attest to its speed, dependability, and user-friendliness. There are 20 assembler directives to provide powerful macros, conditional assembly, and flexible data generation. INCLUDE and TARGET FILE capabilities allow source programs to be as large as your disk space. The integrated, co-resident source program editor provides global search and replace, move, and edit. The EDIT command has 15 sub-commands combined with global selection.

Each S-C Assembler diskette contains two complete ready-to-run assemblers: one is for execution in the mother-board RAM; the other executes in a 16K RAM Card. The HELLO program offers menu selection to load the version you desire. The disks may be copied using any standard Apple disk copy program, and copies of the assembler may be BSAVED on your working disks.

S-C Software Corporation has frequently been commended for outstanding support: competent telephone help, a monthly (by subscription) newsletter, continuing enhancements, and excellent upgrade policies.

# **QUICKTRACE**

**relocatable program traces and displays the actual machine operations, while it is running without interfering with those operations. Look at these FEATURES:**

**Single-Step mode displays the last instruction, next instruction, registers, flags, stack contents, and six user-definable memory locations.**

**Trace mode gives a running display of the Single-Step information and can be made to stop upon encountering any of nine user-definable conditions.**

**Background mode permits tracing with no display until it is desired. Debugged routines run at near normal speed until one of the stopping conditions is met, which causes the program to return to Single-Step.**

**QUICKTRACE allows changes to the stack, registers, stopping conditions, addresses to be displayed, and output destinations for all this information. All this can be done in Single-Step mode while running.**

**Two optional display formats can show a sequence of operations at once. Usually, the information is given in four lines at the bottom of the screen.**

**QUICKTRACE is completely transparent to the program being traced. It will not interfere with the stack, program, or I/O.**

**QUICKTRACE is relocatable to any free part of memory. Its output can be sent to any slot or to the screen.**

**QUICKTRACE is completely compatible with programs using Applesoft and Integer BASICs, graphics, and DOS. (Time dependent DOS operations can be bypassed.) It will display the graphics on the screen while QUICKTRACE is alive.**

**QUICKTRACE is a beautiful way to show the incredibly complex sequence of operations that a computer goes through in executing a program**

## **QUICKTRACE**

Quickie No. 5.....**Horst Schneider**

To print a dashed line on the screen:

```

JSR $FD9C Print one dash
JSR $FCA3 same character across screen

```

To print any character across screen:

```

LDY #0
LDA #$xx xx = ASCII screen code for char
JSR $FCA3

```

To print any character across most of screen:

```

LDY #xx xx = starting column
LDA #$yy yy = ASCII screen code for char
JSR $FCA3

```

## Adding Decimal Values from ASCII Strings...Bob Sander-Cederlof

The program below shows a nifty way to add two decimal values together and get the result as an ASCII string, without ever converting decimal to binary or binary to decimal.

The example shows two six-character values being added, but any length would work the same. For simplicity's sake I used a leading zero format, and allow no signs or decimal points. Fancier features can wait for more cerebral times.

The beautiful part is the way the 6502's carry flag works. On entering the add loop, I clear carry. Then I add a pair of digits, preserving the ASCII code. If the sum is more than "9" (\$39), the CMP will leave carry set, prepared for subtracting 10 at line 1160. After subtracting 10, carry will be set (because the SBC caused no borrow). This carry then propagates to the next digit.

Strictly speaking, I should allow the sum to be one digit longer than the addend and augend strings, and store the final carry value there. Any reasonably useful version would also allow leading blanks and decimal points, be callable as an &-routine with string parameters, automatically handle non-aligned decimal points, and allow negative numbers. I'll try all these for next month.

```

# Help Wanted?

## Assistant Programmer™

Menu Generator and Screen Text Editor

- A ccepts all characters from keyboard (including " [ / \_ ").
- S hifts individual lines or entire page with I-J-K-M keys.
- S plits a line or combines two lines at cursor position.
- I nserts input or variable print commands at cursor position.
- S paces added or deleted between lines with a single keystroke.
- T ext file created to "EXEC" menu (BASIC) into your program.
- A ccents your titles with borders, using minimum amount of bytes.
- N o disk swapping, entire program resides in memory for easy access.
- T ext file created that reinstalls screens for future development.
- P rints copy of menu in screen format with row and column edge scales.
- R enders line at cursor position inverse or flashing with keystroke.
- O verhaul your existing menu with transparent capture routine.
- G ives printed list of input/print commands with row & column numbers.
- R ight, left and center justification of menu at cursor position.
- A ll features and procedures fully documented and tutored.
- M enus can be designed on the screen, no need for graph paper layouts.
- M akes horizontal lines print in vertical format at the touch of a key.
- E rror messages displayed for all options (display voidable).
- R eturn coupon for your ticket to fast, efficient and friendly menus.

**ALL FOR ONLY \$49.95.**

**Still More on Hardcore Magazine.....Bob Sander-Cederlof**

I bought the latest, Vol. 1 No. 3, off the newsstand a few days ago. It is 72 pages, \$3.50. I believe those 72 pages far surpass in usefulness the 600-odd pages of some familiar monthlies. A highlight for me was a complete assembly listing (in S-C format!) of HyperDOS, by John Bridges.

HyperDOS modifies the LOAD and BLOAD commands so that loading runs up to five times faster. This is the same improvement factor offered by a half dozen DOS-mods on the market, such as DOS Enhancer from S&H Software. (Of course, DOS Enhancer also speeds up SAVE and BSAVE, and include many other useful utilities with the package.)

If you are a nibble copier, you will be pleased with the listing of parameters for Locksmith and Nibbles Away II. As usual, there are a lot of hints on "how to unlock" those copy-protected disks: see "Controlling the I.O.B.", and "Boot Code Tracing".

Bev Haight (author of "Night Falls", among others) gives some excellent information on graphics, games, and even secrets to publishing. Bev describes, explains, and lists a new game called "Zyphyr Wars" for your pleasure and edification.

There is a lot more. Even an interview with Mike Markkula regarding Apple's position on software protection!

Issue number 4 promises to focus on graphics: novice-to-expert how-to's, complete graphic aid programs, tables, charts, reviews, etc.

**The New "What's Where".....Bob Sander-Cederlof**

Micro has doubled the size and tripled the value of their "What's Where in the Apple" book. There is now a 152-page double-column type-set 20-chapter text together with the previously published atlas and gazetteer. The new edition retails at \$24.95 (our price \$23).

If you already have the older edition, you only need the update, called "The Guide to What's Where", for \$9.95 retail (our price (\$9 even)).

If you order books from us, remember to include enough for shipping.

# ***the most controversial computer magazine***

## Programming a Language Card.....Bill Morgan

Recently we've received a couple of questions about the exact meaning of all those \$C08x addresses used to access a language (or RAM) card in slot 0. Here's a rundown of what memory cards are and how to use them.

A RAM card is a plug-in board containing an extra 16K (or more) of memory, which can be used instead of the language ROMs on your Apple motherboard. The \$C08x addresses are switches that determine which memory will be used whenever you read or write an address from \$D000-\$FFFF. With the proper use of the switches on a 16K card, your Apple becomes a machine with 76K of memory! (That includes motherboard RAM, motherboard ROM, and the full RAM card.)

Here's a summary of the addresses and their functions:

| Address | Read   | Write  | Bank |
|---------|--------|--------|------|
| -----   | ----   | -----  | ---  |
| \$C080  | Card   | Mother | 2    |
| \$C081* | Mother | Card   | 2    |
| \$C082  | Mother | Mother | 2    |
| \$C083* | Card   | Card   | 2    |
|         |        |        |      |
| \$C088  | Card   | Mother | 1    |
| \$C089* | Mother | Card   | 1    |
| \$C08A  | Mother | Mother | 1    |
| \$C08B* | Card   | Card   | 1    |

The stars indicate addresses which must be accessed twice to have effect (these are the ones that write-enable the card.)

These addresses are "soft switches", much like those for switching the screen display modes. To throw a switch, just use a LDA or any instruction that reads the location. From BASIC you can use a PEEK. STA or POKE also work with most RAM cards, but not all of them. Experiment with yours to see how it behaves. If you're writing a program for use on other people's Apples it's safest to stay with instructions that read the location.

The Bank column refers to the fact that a language card actually has 16K of memory, but the range from \$D000 to \$FFFF is only 12K. The other 4K ought to be \$C000-\$CFFF, but that's the area that Apple uses for special Input/Output functions. Therefore, there is an extra 4K "bank" which can be addressed at \$D000-DFFF. Normally, only Bank 2 is used. If a program gets bigger than 12K it becomes necessary to use Bank 1, but that starts getting complicated. The best approach is to put routines or data in bank 1 that don't have to refer to anything in bank 2. You can then have the main code above \$E000 decide which bank to use.

Some programs seem to use the motherboard and RAM card memories at the same time. Examples of this are ES-CAPE.LC and the programs that relocate DOS into the RAM card. Generally, these have a short "bridge" or "switcher" routine somewhere in the motherboard RAM. When the program in the RAM card needs to call a routine in the motherboard ROM, it actually calls the bridge. The bridge routine then throws the appropriate \$C08x switches and calls the necessary ROM routine. When that routine finishes, the bridge then switches back to the RAM card and continues the program there.

Another thing to consider is whether the program in the RAM card needs the system monitor. If so, you need to make sure there is a copy of the monitor on the RAM card. Here's how to use the monitor to copy itself into a RAM card:

```
]CALL-151
*C081 C081
*F800<F800.FFFF
```

That monitor move instruction looks like nonsense, but remember that the \$C081 switch sets the computer to read from the motherboard and write to the RAM card.

### The Book of Apple Software 1983

It's huge! Nearly 500 pages of insightful reviews and comparison charts, covering business, education, utilities, and games. The review of seven assemblers includes Merlin, Lisa 2.5, Tool Kit, LJK Edit 6502, MAE, S-C Assembler II (4.0) and S-C Macro Assembler. S-C Macro tied for first place with Merlin in the overall ratings, but surged ahead in the detail. Consider: not copy protected, typeset programmer reference card, cassette support, monitor and DOS commands without leaving assembler, FANTASTIC upgrade policy, RAM card optional, compressed source code, 32 character labels, and more.

Anyway, back to The Book....you owe it to yourself to consult therein before buying software. Even if the one you want to buy isn't in the book, you will get a broader perspective. I recommend it.

## **Seed Thoughts on Extensions.....Sanford Greenfarb**

I am currently between computers. My 4 1/2 year old Apple died and I have ordered a Basis 108 to replace it. While waiting, I have been doing some thinking; I came to the conclusion that I can extend, by appropriate coding, either the monitor or Applesoft (or both) into the unused 4K bank of my 16K RAM card. That second 4K bank at \$D000-DFFF is just sitting there, with nothing to do. In all the Apple mags I have seen no one approaches thi idea. Maybe they know something I don't, but as soon as my computer comes I am going to try it.

I suspect that I could insert code at \$FF7A in the monitor to switch 4K banks and jump to \$D000 for a modified character search subroutine. This way I could add more control characters and routines to the monitor. This would add features while keeping all the standard entry point address unchanged.

I don't know why no one has used this concept, or at least not publicly. I am offering this idea to you readers of Apple Assembly Line. I can't work on it until my new computer comes anyway, and you will probably think of a lot of good uses.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                |

| Use DISASM, the intelligent disassembler, to convert 6502 machine code into meaningful, symbolic source. It creates a text file which is directly compatible with DOS ToolKit, LISA and S-C (both 4.0 & Macro) Assemblers. Use DISASM to customize existing machine language programs to your own needs or just to see how they work. DISASM handles multiple data tables, invalid op codes and displaced object code (the program being disassembled doesn't have to reside in the memory space in which it executes). DISASM lets you even substitute MEANINGFUL labels of your own choice (100 commonly used Monitor & Pg Zero names included in Source form to get you rolling). The address-based cross reference table option results in either a selective or complete cross reference (to either screen or printer). Page Zero and External references are listed separately in numeric order. The cross reference table provides as much insight into the inner workings of machine language programs as the disassembly itself. DISASM has proven to be an invaluable aid for both the novice and expert alike. | \$30.00        |

### **Utilities For Your S-C Assembler (4.0)**

|                                                                                                 |         |
|-------------------------------------------------------------------------------------------------|---------|
| SC.GSR: A Global Search and Replace Eliminates Tedious Manual Renaming Of Labels.....           | \$20.00 |
| SC.XREF: A Linenumber-Based Global Cross Reference Table For Complete Source Documentation..... | \$20.00 |
| SC.TAB: Tabulates Source Files Into Neat, Readable Form. Encourages Fast, Free-Format Entry.... | \$15.00 |
| SC UTILITY PAK: Includes All Three Utilities Described Above (You Save \$10.00).....            | \$45.00 |

All of the above programs are written entriely in machine language and are provided on a standard 3.3 DOS formatted diskette.

\*\*\*\*\* SAY YOU SAW IT IN 'APPLE ASSEMBLY LINE'! \*\*\*\*\*

A Plug for some Neat New Products.....Richard Fabbri  
Ridgefield, CT

Take a peek at BYTE Magazine, August 1982, Steve Ciarcia's article on the TMS9918-based Color graphics for Apple II. It has proved to be fantastic! You get 15 colors plus transparent, 32 sprite planes to overlay a 15-color hi-res of 256 dots by 192 lines. It works as advertised! Digital Dimensions (see BYTE, Nov 1982, page 352) advertises this as "E-Z Color" board, for \$230. I have had one now for a month.

Two other neat new board for the Apple from Number Nine Computer Engineering Inc:

- \* a graphics board with 1024x1024 resolution; 256 colors from a palette of 4096; HARDWARE drawing of circles, arcs, rectangles and vectors; characters; area fill; light pen interface; \$750 to \$1090, depending on options.
- \* a processor card with 3.6 MHz 6502, 64K on-board high-speed RAM, transparent execution of all Apple II software, software-controlled speed for timed I/O operations; \$745.

If you are interested: contact Number Nine at (203) 233-8134, or P.O.Box 1802, Hartford, CT 06144.

#### A Legible Phone Number for Computer Micro Works

Their ad last month was a little fuzzy around the area where the phone number was. The correct number is (305) 777-0268. George Beasley or his wife will take your order. This number is in Florida, where George is stationed with the Air Force.

I ordered one of their "Promette's". It is different than I thought, and better. Most such adapters will not work when a language card is in slot 0, because EPROM's are missing one of the enable lines the Apple uses. But the Promette has an active device inside which adds the extra enable line, so it works like you want it to. Another nice difference is that George's price is about 1/4 the normal price for these items.

Apple Assembly Line is published monthly by S-C SOFTWARE CORPORATION, P.O. Box 280300, Dallas, Texas 75228. Phone (214) 324-2050. Subscription rate is \$15 per year in the USA, sent Bulk Mail; add \$3 for First Class postage in USA, Canada, and Mexico; add \$13 postage for other countries. Back issues are available for \$1.50 each (other countries add \$1 per back issue for postage).

All material herein is copyrighted by S-C SOFTWARE CORPORATION, all rights reserved. (Apple is a registered trademark of Apple Computer, Inc.)
